Whitening Gels

Overview

Blended Gel

The original powerhouse gel, this gel can be used on everyone, and everyone can get some degree of results. You can guarantee results (not how much) with this gel. It is a blend of both Carbamide and Hydrogen peroxide that has an equivalent of a 16%HP without the sensitivity. Only 1ml and 3-15-minute intervals are needed to deliver results. You can use the deep scrubs to boost results, in most cases doubling them. We suggest this be an upsell or a premium, you can also offer an extra 15 minute round for a fee of your choice. This is ideal for someone who wants to boost them even further and we recommend no more than 1 hour of total whitening time.

Botanical Whitener (DISCONTINUED)

This gel has absolutely zero peroxide and vegan friendly glycerine. It's base is a baking soda and aloe vera blend. It is perfect for the vegan community, nursing or pregnant women and children as young as 12. Use up to 2ml and 3-20 minute intervals are recommended. Since there is no peroxide this is not necessarily a bleaching but more a deep cleaning and stain lifting process. Results cannot be guaranteed on everyone (but I have never had someone not whiten with this gel), it would not be ideal for heavy staining, tetracycline, plaque build up or teeth with discoloration.

24k Gold

This is made the way as the original as a blend of both carbamide and hydrogen but with great portions offering an equivalent strength of 20% HP. The nano-gold also works in conjunction with the whitening gel making it stronger, the gold also has bacteriostatic properties that help control oil bacteria and could help with gum disease and plaque build up. Deep scrubs are highly encouraged with this whitening gel as they will reduce the chance of sensitivity with this gel. Results can be guaranteed. Use up to 1ml per client 3-15 minute intervals (you can go up to 1 hour with this gel and either do a full hour or offer an extra round at the end as a premium). The dual barrel syringe comes with a special tip that will mix both sides of the syringe (the gold and the peroxide) together as you dispense into your dish.
